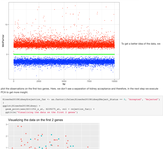
Data

Data description in Ghosseiri et al. 2015

```
dim(train.TCGAcancerGeneExpr)
# [1] 1097 20531 (samples x genes)
# [1] 1097 20531 (samples x genes)
# [1] 1097 20531 (samples x genes)
table(train.TCGAcancerGeneExpr$cancer.type)
# BRCA COAD KIRC LUAD PRAD
# 300 136 146 299 216
```

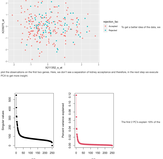
Exploration of the Data

The data consists of 20531 genes and 1097 samples, belonging to five different types of cancer, namely breast cancer (BRCA), colon cancer (COAD), kidney cancer (KIRC), lung cancer (LUAD) and prostate cancer (PRAD). The following pie chart shows the relative frequencies of the different cancer types in the data set. As a reference, we have to remember that our sample consists of 300 samples for breast cancer, 136 samples for colon cancer, 146 samples for kidney cancer, 299 samples for lung cancer and 216 samples for prostate cancer. The following pie chart illustrates the relative frequencies of the different cancer types in our data set. As we can see, the relative frequencies are roughly the same as in our sample, namely 27.3% for breast cancer, 12.4% for colon cancer, 13.3% for kidney cancer, 27.2% for lung cancer and 19.7% for prostate cancer. Thus, we can conclude that our sample is representative for the population.



plot the observations on the first two genes. Note, we don't see a separation of kinds, acceptance and rejection, in the two data sets accounts PC1 to get clear image!

```
plot(train.TCGAcancerGeneExpr[,1:2], col=ifelse(train.TCGAcancerGeneExpr$cancer.type == "Accepted", "Accepted", "Rejected"))
# or:
ggplot(train.TCGAcancerGeneExpr,
  aes(x=`?|100001_at`, y=`?|100002_at`, col = train.TCGAcancerGeneExpr$cancer.type))
  geom_point(alpha=0.5)+ggtitle("Visualizing the data on the first 2 genes")
```

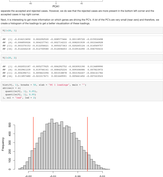


plot the observations on the first 2 principal components. Note, we don't see a separation of kinds, acceptance and rejection, in the two data sets accounts PC1 to get clear image!

variability of 5 and with the first PC1 is at least 20% of the variability of PC1.

Accepted is the expected cancer, we assume whatever kinds, rejection is associated the first two PC1, PC2. The following plot illustrates that!

```
# Accepted is 0 and rejected is 1
PC1_Accepted <- NULL; PC2_Accepted <- NULL;
PC1_Rejected <- NULL; PC2_Rejected <- NULL;
for(i in 1:nrow(train.TCGAcancerGeneExpr)){
  if(train.TCGAcancerGeneExpr$cancer.type[i] == "Accepted"){
    PC1_Accepted <- c(PC1_Accepted, pr.out$x[i,1])
    PC2_Accepted <- c(PC2_Accepted, pr.out$x[i,2])
  }else{
    PC1_Rejected <- c(PC1_Rejected, pr.out$x[i,1])
    PC2_Rejected <- c(PC2_Rejected, pr.out$x[i,2])
  }
}
ggplot(pr.out$x[,1:2],
  aes(x=PC1_Accepted, y=PC2_Accepted, col="Accepted"))
  geom_point(alpha=0.5)+ggtitle("Scores for 2 PCs")
  +geom_point(aes(x=PC1_Rejected, y=PC2_Rejected, col="Rejected"))
  +xlab("PC1")+ylab("PC2")+labs(col="")
```



separate the accepted and rejected cases. However, we see that the rejected cases are more present in the bottom left corner and the accepted cases in top right corner.

Now, we want to see the contribution of other genes are strong for PC1, 2 of the PC1s are very small (very) and therefore, we have a measure of the variability of all genes. Visualization of these values:

```

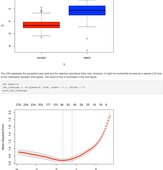
Exploration of the Data

The following pie chart illustrates the relative frequencies of the different cancer types in our sample. As we can see, the relative frequencies are roughly the same as in our sample, namely 27.3% for breast cancer, 12.4% for colon cancer, 13.3% for kidney cancer, 27.2% for lung cancer and 19.7% for prostate cancer. Thus, we can conclude that our sample is representative for the population.



```

We clearly can see that with the subset of genes the same result can be obtained.

Finally, assess PC1 and PC2 to see if the genes are in the discriminant vector and the linear membership, we recreate LDA. When searching the LDA it is an unbiased the scaling that the variables are centered, which is confirmed by the sparse PCA.

```
library(MASS)
train.lda <- lda(cancer.type, data=train.TCGA
  cancer.type, prior=c(0.2,0.2,0.2,0.2,0.2))
  # [1] 0.0000000 0.0000000 0.0000000 0.0000000 0.0000000

```

The CDF separates the accepted (red line) and the rejected (see black line) well. However, it might be worthwhile to execute a sparse LDA due to the continuously between this genes. The rest of the is a bottleneck in the test figure.

We see that the accepted cases are

shrunken centroid and the sparsed cases around 1. An hypothesis testing that every gene in the data set is an indicator for testing rejection. In the following we will use the shrunken centroids to see which genes are important. We will use the shrunken centroids to see which genes are important. We will use the shrunken centroids to see which genes are important. We

Fig. 1 Volcano plot of 1,000 differentially expressed genes in the simulated data. Genes with FDR < 0.05 are marked in red. The dashed line represents the FDR cut-off. Genes above the dashed line are considered significant.

Shorter version over hypothesis testing: only test

We can also use a cut-off on a score given an differential expression statistic instead of the p-value reported above. Since we do not know a priori whether differentiated genes will show higher or lower expression, we define a score based on absolute values:

$$s_{i,j,k} = |\Delta_{i,j,k}| + |\Delta_{i,j,k'}|$$

We find performance metrics for every gene in the data, with an individual significance level of 0.05 (DEA genes). The histogram indicates that the majority of genes are not differentiated, and that the score of the differentiated genes is higher than that of the non-differentiated genes.

Using ranking and pooling the scores, we can compute the number detected as a function of the FDR. Moreover we can compute, AUC, TPR, precision and recall. The ROC curve shows the number of correctly detected differentiated genes (TPR) against the number of false positives (FP). The dashed line represents the number of correctly detected genes (TP

```

```
##   PANEL group     AUC
## 1     1    -1 0.85506
```

The next step is to determine a good threshold c as a prediction cut-off. This cutoff is chosen as to minimize the misclassification error. For this, we will use our test data. We are interested in the sensitivity ($\frac{TP}{TP+FN}$) and specifity ($\frac{TN}{TN+FP}$) of the final model. We find the following cutoff and corresponding sensitivity and specificity.

```
## [1] 0.4
```

```
## [1] NaN
```

```
## [1] NaN
```

Conclusions
